Dimensional Modeling: The Heart of Kimball's Methodology
Why Dimensional Modeling? Kimball's emphasis on dimensional modeling stems from its simplicity and effectiveness in facilitating query performance and understandability. Unlike normalized schemas, dimensional models optimize for read performance and ease of use.
Components of a Dimensional Model:
Fact Tables: Central tables containing numeric measures
Examples: Sales revenue, units sold
 Typically contain foreign keys referencing

dimensions
Dimension Tables: Descriptive attributes providing context
Examples: Customer demographics, product categories
Designing Effective Star Schemas
Identify the Grain: Decide on the level of detail stored (e.g., daily sales per store)
Select Dimensions: Choose relevant descriptive attributes
Create Surrogate Keys: Use non-meaningful, system-generated keys for stability
Define Hierarchies: For drill-down and aggregation (e.g., Year > Quarter > Month)
Handling Slowly Changing Dimensions (SCDs)
 Kimball categorizes SCDs into types, with Type 2 being most common
 tracking historical changes by creating new records. Proper management of SCDs ensures accurate historical reporting.
The Bus Architecture and Conformed Dimensions
The Bus Architecture
 Kimball's bus architecture promotes building a set of conformed dimensions that serve multiple data marts, enabling integrated, enterprise-wide analysis.
Benefits: Consistency in metrics and dimensions
 Reduced redundancy
 Easier maintenance and scalability
Conformed Dimensions
 Dimensions that are standardized across various subject areas, supporting cross-functional analysis. For example, a Customer Dimension used in sales, marketing, and service marts.
Implementing the Bus Matrix
 A visual tool mapping how different data marts share conformed dimensions and facts, guiding incremental development.
