Common Questions and Sample Answers in PLTW Unit 3

Below are typical questions students might encounter, along with detailed explanations and sample answers to clarify the reasoning process.

Question 1: Calculating Gear Ratios

If a gear train has a gear A with 20 teeth and gear B with 60 teeth, what is the gear ratio? How does this ratio affect the output speed?

Answer: Gear ratio = Number of teeth on driven gear / Number of teeth on driver gear = $60 / 20 = 3:1$.

Effect on speed: The gear ratio of 3:1 means that for every 3 rotations of gear A (driver), gear B (driven) completes 1 rotation.

Implication: The output speed decreases by a factor of 3, but torque increases proportionally. Understanding this helps students see how gear ratios influence the trade-off between speed and torque in mechanical systems.

Question 2: Mechanical Advantage of a Lever

A lever is used to lift a 200 N weight. The effort applied at the other end of the lever is 50 N. What is the mechanical advantage of the lever?

Answer: Mechanical advantage (MA) = Load force / Effort force = $200 \text{ N} / 50 \text{ N} = 4$.

Interpretation: The lever multiplies input force by a factor of 4, making it easier to lift heavy loads with less effort. This reinforces the concept that simple machines like levers provide mechanical advantage, reducing the effort needed to perform work.

Question 3: Identifying the Type of Mechanism

Given a diagram of a linkage that converts rotary motion into oscillating motion, identify the type of mechanism.

Answer: Likely a four-bar linkage or oscillating crank, depending on specific linkages.

Explanation: Four-bar linkages are common in converting rotary motion into linear or oscillating motion, used in various mechanical devices like windshield wipers or pistons. Students should analyze the linkage diagram to identify

pivot points, link lengths, and the motion path.

Question 4: Calculating Power in a Mechanical System

A motor applies a force of 50 N to move a mechanism at a velocity of 2 m/s. What is the power output?

Answer: Power (P) = Force (F) $\times$ Velocity (v) = 50 N $\times$ 2 m/s = 100 Watts.

Significance: Power measures how quickly work is done; understanding this helps evaluate system efficiency.

Tips for Using Test Answers Effectively

Use answers as a learning tool: Review explanations to deepen understanding. Cross-reference with class notes and textbooks to clarify misconceptions. Practice similar problems to reinforce concepts and improve problem-solving speed. Seek feedback from teachers or peers to ensure comprehension.
